Along with this, it introduces many new elements for example on the graphical side. Then I started to do the plumbing for the switching of the bank. Here, the entire PIN 1 on the ROMs was already interconnected, with a GND connection at one end and a connection to an array of resistors at the other end. The original 2012 version only worked on the original Taito (and Mame) hardware, but when the authors discovered Redux, they were inspired to try and make a Bootleg-PCB version as well; And like Lost Cave V1.2 (December 11, 2013) it also runs on bootleg boards (types without a 68 705; thus the same criterion as REDUX REDUX). Also, before I even started, I had checked that the lost cavern v1.2 would actually be correct on my table, so I had a full set of files for that too. That works great, but another exciting project is the Lost Cave, which originally released on December 11, 2012. Here I will post every time I do a new blog post, but I also do small posts about Progress of current projects etc. That's why it's also a piece of red Kynar to patch this on the next photo showing how PIN 1s are connected to the wire-wire. Now to attract him, I had to first identify the Union set of all ROMs that must be exchanged to go from the bootleg straight to Redux or lost the cave. This is easily done i.e. in a Windows CMD prompt with the command ~-> Copy/B ROM1 + Combined ROM2 ROM for each pair of ROM files; of cause taking care, that the files of the same set were always before/hardly);-D, so I replaced all the 27 256-ROMs to be exchanged with the newly programmed 27 512 ROM and fired the board of excitement);- p Now is just the marvel of puaunur, isn't it like this? The first thing to note is that all the ROMs of the Council are 27256 the next thing to notice is that EPROM in the Serie 27 arrives in "Cluster" "Cluster" Factors of shape administered by the type of dive packages. "New" are in quotation marks, as the best levels from various ports is actually, which were relegated to the original arcade platform. Now if you compare the Pinouts of 27256 and 27512 you'll find that they are almost identical except for Pins 1 and 22. Now Pin 22 We don't have to worry, as the EPROM will only work in reading mode on the board. These are marked with 3 red arrows; I also accidentally (it was late nite): - s) cut the connection to the pin 2 on the central part of the ROM (blue arrow). Thus, IE 2716 and 2732 are both dip24, while 2764, 27128, 27256, 27512 are all dip28 and so on. The 27512 uses PIN 1 as the additional address pin and has PIN 22 double as both output mode (in reading mode) and the programming voltage (in programming mode). I welcome you to visit, it's like 'If you want to be updated on the things I do. First of all, I need a + 5V on-on switch on a pole and GND on the other; The center will therefore be the "bank switch". Now it was all the hydraulic system necessary on the primary card. I downloaded the lost cave (bootleg) Á ç rom set and installed it on my card, and it worked as a charm; Jawsome Game! } ;-P now lost the cave is a completely new game with new levels and stuff. The original levels are no longer present in the game. Now the Redux are marked with bow ties and the lost cave is marked by Fezzs ... the union set is only causing all the ROMs marked) :-P .); - P as the last thing in this post, I would like to mention, which I recently created a Facebook page, will make it a little easier to follow the blog. But PIN 1 will allow you to switch from an upper and lower bit to EPROM 256K. Secondary council .elicaf 'AIP .elicaf 'Aip Álaer ni
